

I believe the bar chart of average monthly rainfall by city is the best visualization because the bars are on a common scale, making it very easy to compare across cities. The bars are also sorted in descending order, so there's no need to make difficult comparisons—everything is laid out clearly. Additionally, the bars are colored differently, which helps the eyes quickly connect the city labels to the corresponding bar lengths without getting lost. While the scatterplot looks visually appealing, it's very difficult to draw clear conclusions from it based on how the data is presented. Similarly, the geographic map showing locations and annual rainfall provides an interesting spatial context but doesn't allow for straightforward comparisons or meaningful takeaways. Overall, the bar chart stands out as the most effective and easy-to-interpret visualization.
